

# Issues of Bio-fuel and Food Security in South Asia

#### Dr Mahfuz Kabir

Senior Research Fellow, Bangladesh Institute of International and Strategic Studies (BIISS), Dhaka; IDMVS, University of Dhaka; IBA, Jahangirnagar University; SEF, Curtin University, Australia E-mail: mahfuzkabir@yahoo.com

Presented at "Regional Consultation on Trade, Climate Change and Food Security in South Asia" Organized by SAWTEE Kathmandu, 20-21 December 2012

# Terminology

- Bioalcohols biologically produced alcohols, most commonly ethanol
- Biodiesel
  - most common biofuel in Europe
  - produced from oils or fats a liquid similar to fossil/mineral diesel
  - · consists mostly of fatty acid methyl (or ethyl) esters
- Green diesel produced through hydro-cracking biological oil feedstocks (e.g., veg oils and animal fats)
- · Used vegetable oil is increasingly being processed into biodiesel
- Bioethers cost-effective compounds act as octane rating enhancers contribute air quality
- Biogas methane produced by the process of anaerobic digestion
- Syngas partial combustion of biomass

# Background

- Energy plays an essential role in an economy on both demand and supply
- Demand side
  - energy is one of the products a consumer decides to buy to maximize utility
- Supply side
  - energy is a key factor of production in addition to capital, labor and materials and is seen to play a vital role in the economic and social development of countries, being a key factor in increasing economic growth and living standards
- SA achieved impressive economic growth
- Growing size of the economy and rising energy demand go hand in hand without few exceptions

# Energy & Economic Growth in SA

	Cointegration	Causality			
		$Y \longrightarrow E$	$E \longrightarrow Y$	$A \longleftrightarrow E$	
Bangladesh	No		$\checkmark$		
India	No				
Nepal			$\checkmark$		
Pakistan	No				
Sri Lanka	No				

- SA is energy deficient/energy hungry
- Energy is a limiting factor of economic growth in Bangladesh and Nepal
- SA Brand new growth-oriented poverty reduction and economic advancement
- Energy diversification energy security bio source

# Debates

- Social, economic, environmental and technical effects
  - moderating oil prices
  - poverty reduction potential
  - carbon emissions levels
  - sustainable bio-fuel production
  - deforestation and soil erosion
  - loss of biodiversity
  - impact on water resources used water, water for input prod<sup>n</sup>
  - energy balance and efficiency
  - electric plant in Łódź importing over 7,000 tons of wood biomass
- Food vs. fuel
  - bio-fuel production accounted for 3-30% of the increase in food prices in 2008
  - $^\circ~$  market-driven expansion of ethanol in the US increased corn prices by 21% in 2009

# Higher demand for biofuels can influence food prices

- Direct purchase of food stocks
  - $^\circ$  for each 1% rise in food prices, caloric intake among the poor drops 0.5%
- Livestock feed costs
  - Grains and oilseeds make up a large part of livestock feeds, so the price of meat, dairy and eggs all rises
- Crop and land substitution
- Use of marginal land
  - 'Low quality' land
  - In India, these are lands used for grazing, harvesting of forest resources, or wildlife

## Scenarios

- REF-01: Assumes historical biofuel development until 2008; feedstock demand kept constant after 2008
- WEO-VI: Assumes transport energy demand and regional biofuel use; Secondgeneration conversion technologies become commercially available after 2015;
- WEO-VI2: Assumes transport energy demand and regional biofuel use as projected by IEA in its WEO 2008 Reference Scenario. Assumes that due to delayed arrival of second-generation conversion technologies all biofuel production until 2030 is based on first-generation feedstocks;
- TAR-VI: Assumes transport energy demand 2008 Reference Scenario. Assumes that mandatory, voluntary or indicative targets for biofuel use announced by major developed and developing countries will be implemented by 2020, resulting in about twice the biofuel consumption. Second-generation conversion technologies become commercially available after 2015; deployment is gradual
- TAR-V3: Assumes transport energy demand 2008 Reference Scenario.Assumes that mandatory, voluntary or indicative targets for biofuel use announced by major developed and developing countries will be implemented by 2020.Accelerated development of second-generation conversion technologies permits rapid deployment; 33% and 50% of biofuel use in developed countries from secondgeneration in 2020 and 2030 respectively.

# People at risk of hunger, baseline projection REF-01

REF-01 Milli	ions 2000	2010	2020	2030	2050

# Additional people at risk of hunger relative to baseline REF-01, in 2020

#### Effect on world price of removing EU biofuels support Euros per tonne

# Food-fuel trade-off

- Land devoted for food production used for BF input
- Less food more people hungry
- Market and profit increased production to ever-expanding frontier

- Water alternative use
- Food for environment
- Air quality vs. food
- Recycling and substitution vs. environmental degradation
- Food price vs. non-bio fuel price

AAGR = Average Annual Growth Rate, CAGR = Compounded Annual Growth Rate **Source:** Calculation based on EIA data.

# Critical issues

- Slow climate change?
- Absorbing cereal production
- A factor in rising hunger
- Fueling deforestation
- Competition for agricultural land
- Environmental impact from biofuel feedstock production

# Depth of hunger<sup>\*</sup> (kilocalories/person/ day)

	1992	1997	2002	2008
Bangladesh	310	330	300	290
India	240	220	220	240

Bio-fuel	Agenda

Country/ Region	Mandatory, voluntary or indicative target	Country/ Region	Mandatory, voluntary or indicative target
Australia	At least 350 million liters biofuels by 2010	Brazil	Mandatory 25 percent ethanol blend with gasoline; 5 percent biodiesel blend by 2010.
Canada	5 percent renewable content in gasoline by 2010		
European Union	5.75 percent by 2010 10 percent by 2020	China	2 million tons ethanol by 2010 increasing to 10 million tons by 2020; 0.2 million tons biodiesel by 2010 increasing to 2 million tons by 2020. 5 percent ethanol blending in gasoline in 2008, 10 percent as of 2009; indicative target of 20 percent ethanol blending in gasoline and 20 percent blodiesel blending by 2017.
Germany	6.25 percent by 2010 10 percent by 2020		
France	7 percent by 2010, 10 percent by 2015, 10 percent by 2020	India	
Japan	0.6 percent of auto fuel by 2010; a goal to reduce fossil oil dependence of transport sector from 98% to 80% by 2030		
		Indonesia	2 percent biofuels in energy mix by 2010, 3 percent by 2015, and 5 percent by 2020.
New Zealand	3.4 percent target for both gasoline and diesel by 2012		
United States	12 billion gallons by 2010, rising to 20.5 billion gallons by 2015 and to 36 billion gallons by 2022 (with 16 billion gallons from advanced cellulosic ethanol)	Thailand	2 percent biodiesel blend by 2008, 10 percent biodiesel blend by 2012; 10 percent ethanol blend by 2012.
		South Africa	2 percent of biofuels by 2013

#### 17

# High Oil Prices

# **SA Perspective**

- food importer increased bio-fuel production of source countries would increase food insecurity
- net importer of many feed-stocks that are being used elsewhere (esp. oils, sugar)
- many of these shocks would come at the same time

   since higher oil prices would lead to greater profitability (and demand for) bio-fuels elsewhere – which will push up feedstock prices
- boost in bio-fuel would reduce poverty more of nonagricultural hhs than of agricultural ones
- pressure on existing water scarcity and declining arable land
- nexus between environmental degradationdeforestation-climate change-food security

- Normative Hunger, poverty, ecology, scarcity why should move
- Positive Why they are moving towards bio-fuel
  - Economics, price, market, R&D
  - Future of energy Driving economy and human civilization
- Imperatives Minimize loss of calorie
- 6,597 kcal non-renewable energy required to produce a litre of ethanol from corn containing 5,130 kcal of energy, leading to 22% loss
- More than 70% of Europe's farmland would be required for biofuel crops for only 10% of road transport fuel
- Even if high yield bio-energy crops were grown on all the arable land on earth, the biofuel produced would cater to only 20% of current demand

# Way forward

- Need for greater understanding and awareness
- Limit liquid bio-fuels for transport
  - $^\circ\,$  pose risks to food security and environmental sustainability
- Agriculture to be put as priority on development agenda
- Discourage food-bio-fuel trade-off
- Ensure that bio-fuels contribute to broad-based rural and agricultural development
- Disentangling threatening bio-fuel
  - not all bio-fuel food-reducing
  - encourage bio-fuel from human-livestock/hh waste
- Assess efficiency and societal value vis-à-vis other current and future energy options in the context of comprehensive national, SA and global energy strategies
